

MAX MRI RADIOLOGY

1450 Vermont Avenue, Los Angeles, CA 90027

PATIENT

Patient: Patrick Donahue

Study Date: December 21, 2024

Examination: MRI LUMBAR SPINE WITHOUT CONTRAST

Referring Provider: Vermont Spine and Injury

CLINICAL HISTORY

Low back pain with right lower extremity radiation following a motor vehicle collision. Conservative care without resolution.

TECHNIQUE

Multiplanar, multisequence imaging of the lumbar spine was performed without intravenous contrast. Sagittal T1, sagittal T2, and axial T2 sequences were obtained.

COMPARISON

No prior lumbar imaging is available for comparison.

ALIGNMENT

Lumbar lordosis is preserved. Vertebral body heights are maintained. No fracture or spondylolisthesis is identified.

FINDINGS

L5-S1: Broad-based disc extrusion measuring 9 x 10 x 5 mm, extending into the right lateral recess with contact upon the traversing right S1 nerve root.

L4-L5: Mild disc bulge without stenosis.

L3-L4: Unremarkable.

IMPRESSION

1. L5-S1 disc extrusion with right S1 nerve root contact.
2. Findings correlate with the reported right lower extremity symptoms.
